Title: Sum of Subset.

Aim: To study and implement Sum of Subset problem

Objective: To introduce Backtracking methods

Theory:

Backtracking is finding the solution of a problem whereby the solution depends on the previous steps taken. For example, in a maze problem, the solution depends on all the steps you take one-by-one. If any of those steps is wrong, then it will not lead us to the solution. In a maze problem, we first choose a path and continue moving along it. But once we understand that the particular path is incorrect, then we just come back and change it. This is what backtracking basically is.

In backtracking, we first take a step and then we see if this step taken is correct or not i.e., whether it will give a correct answer or not. And if it doesn't, then we just come back and change our first step. In general, this is accomplished by recursion. Thus, in backtracking, we first start with a partial sub-solution of the problem (which may or may not lead us to the solution) and then check if we can proceed further with this sub-solution or not. If not, then we just come back and change it.

Thus, the general steps of backtracking are:

- start with a sub-solution
- check if this sub-solution will lead to the solution or not
- If not, then come back and change the sub-solution and continue again.

The subset sum problem is a classic optimization problem that involves finding a subset of a given set of positive integers whose sum matches a given target value. More formally, given a set of non-negative integers and a target sum, we aim to determine whether there exists a subset of the integers whose sum equals the target.

Let's consider an example to better understand the problem. Suppose we have a set of integers [1, 4, 6, 8, 2] and a target sum of 9. We need to determine whether there exists a subset within

State space tree for $n=3$

* Any path from the root to leaf forms a subset.

Q. Solve the sum of subset problem using backtracking strategy for the following data $n=4$
 $W = (w_1, w_2, w_3, w_4) = (11, 13, 24, 7)$
and $M=31$

Sub set Items	condition	Comment
$\{ \}$	0	Initial condition
$\{11\}$	$11 < 31$	Add next element
$\{11, 13\}$	$24 < 31$	Add next element
$\{11, 13, 24\}$	$48 < 31$	Sub set exceeds sum, so backtrack.
$\{11, 13, 7\}$	31	Solution found.

Implementation:

```
#include <stdio.h>

#define MAX_SIZE 100

int isSubsetSum(int set[], int n, int sum) {
    int i;
    if (sum == 0) return
        1;
    if (n == 0 && sum != 0)
        return 0;
}
```

```
    if (set[n - 1] > sum)
        return isSubsetSum(set, n - 1, sum);

    return isSubsetSum(set, n - 1, sum) || isSubsetSum(set, n - 1, sum - set[n
- 1]);
}

void findSubsets(int set[], int n, int sum, int subset[], int subsetSize, int
idx) {
    int i;
    if (sum == 0) {
        printf("Subset found: ");
        for (i = 0; i < subsetSize; i++) {
            printf("%d ", subset[i]);
        }
        printf("\n");
        return;
    }

    if (idx == n)
        return;

    subset[subsetSize] = set[idx];
    findSubsets(set, n, sum - set[idx], subset, subsetSize + 1, idx + 1);

    findSubsets(set, n, sum, subset, subsetSize, idx + 1);
}

int main() {
    int set[] = {10, 7, 5, 18, 12, 20, 15};
    int n = sizeof(set) / sizeof(set[0]);
    int sum = 35;
    int subset[MAX_SIZE];
    if (isSubsetSum(set, n, sum)) {
        printf("Subset with sum %d exists.\n", sum);
        findSubsets(set, n, sum, subset, 0, 0);
    } else {
        printf("No subset with sum %d exists.\n", sum);
    }
}
```

Vidyavardhini's College of Engineering and Technology

Department of Artificial Intelligence & Data Science

```
}  
  
    return 0;  
}
```

Output:

```
C:\TURBOC3\BIN>TC  
Subset with sum 35 exists.  
Subset found: 10 7 18  
Subset found: 10 5 20  
Subset found: 5 18 12  
Subset found: 20 15
```

Conclusion: The implemented backtracking solution effectively determined whether a subset with a specified sum exists within a given set. It showcased the versatility of backtracking algorithms in solving combinatorial optimization problems like the Subset Sum Problem efficiently. This approach provides a foundational method for addressing similar challenges with varying constraints or objectives.
